

## Top 10 problems we find with our competitor's systems:

Other companies keep our service department busy! Here are a few of the problems we have encountered while repairing systems installed by other companies:

1. Poor coverage – improper head spacing. *During a long hot summer, do you want brown spots all over your lawn? Do you want to drag your hose over to get that one wilting azalea? With a Waterwise Irrigation system, this is never a problem.*
2. Installer will not return phone calls. Have you hired a reliable company that will be there if something goes wrong with your system? Did you save a few dollars only to find that you have a poorly designed, problematic system and no one is there to stand behind their work? *Waterwise Irrigation has been around for years and we stand behind our work.*
3. Designs do not allow for plant growth. *New house, new landscaping – what happens when those shrubs mature? With a Waterwise system, we plan for future growth.*
4. Low pressure due to excessive gallonage draw. We have found many poorly designed systems with too many sprinklers on a zone & improper nozzle sizes. The sprinklers do not pop-up all the way and spray is inadequate. *Proper design is the key and we provide it, guaranteed!*
5. No main shut-off valve. We often have people calling in a panic because they have a main line leak and have to shut-off the water to their entire home. How convenient is that? *With a Waterwise system, you simply turn a ball valve and your system is shut off near the water meter.*
6. Electrical valves boxed in. One of the most common problems we have come across in our repairs – several electric valves boxed in together. This creates a problem when you have one valve go bad. Instead of replacing the one bad valve, you have to replace all the valves. This is a very costly mistake. *Waterwise installs valves for easy access and replacement.*
7. No protection for rain sensor wire. Weed eaters love these. *We install our rain sensor wires in schedule 80 pipe to prevent accidental cutting of wires.*
8. Electrical connections not waterproof and improper wire used. *All of our valves are wired with direct burial wire & waterproof connections.*
9. Mixing spray sprinklers & rotary sprinklers on the same valve. *This is a rookie mistake. Different type sprinklers have different flow rates and spray patterns. You never mix two different types of sprinklers on the same zone.*
10. Improper or no instructions on how to water properly. *With a Waterwise system, you are working with employees experienced in horticulture. We know what your plant material needs and we will instruct you on proper watering procedures.*
